

Protein and Energy Nutrition of the Neonatal Calf

Drew A. Vermeire, Ph.D., PAS, Dipl. ACAN
Nouriche Nutrition Ltd.

Part I – WIT-FM?

WIT-FM?

What's in this for me?

What's in this for me?

- 1) More efficient gain
- 2) Lower cost of gain
- 3) Better carcass quality

Part II –
Things We Forgot...
Then,
Recently Re-Discovered:

Milk Replacer
Balance
Determines
Calf
Performance

Rate of Gain,
Efficiency of Gain, and
Composition of Gain
Depends on
Protein:Energy Ratio.

Effect of Lipid and Protein Level vs Performance of *Litopenaeus vannamei*

Lipid Level, %	3	3	3	11	11	11
Protein Level, %	10	18	25	10	18	25
Survival Rate, %	75.8	82.2	92.5	66.7	74.2	75.8
Weight Gain, mg	64.4	72.4	76.7	58.3	74.1	71.4
Feed:Gain	2.4	1.9	1.6	3.0	2.1	2.1

20 Amino Acids

Schematic diagrams of the 20 amino acids

(picture taken from www.chemistry.pomona.edu)

Alanine (Ala)

Arginine (Arg)

Asparagine (Asn)

Aspartic Acid (Asp)

Cysteine (Cys)

Glutamine (Gln)

Glutamic Acid (Glu)

Glycine (Gly)

Histidine (His)

Isoleucine (Ile)

Leucine (Leu)

Lysine (Lys)

Methionine (Met)

Phenylalanine (Phe)

Proline (Pro)

Serine (Ser)

Threonine (Thr)

Tryptophan (Trp)

Tyrosine (Tyr)

Valine (Val)

Amino Acids

- Protein Synthesis – Building Blocks
- Hormone Synthesis and Modulation – Arginine and Growth Hormone
- “Amino Acid Imprinting” Combination of glucogenic and branched chain amino acids in milk replacer for 1st 14 days significantly increased marbling 18 months later

Amino Acids Are Toxic!

Toxicity of Methionine in Neonatal Calves: Methionine Intake vs Performance

g/d DL-MET	<u>0</u>	<u>6</u>	<u>12</u>	<u>18</u>	<u>24</u>
DMI, kg/d	1.55	1.59	1.55	1.24	1.21
ADG, g/d	261	400	243	-229	-129
g gain/kg feed	169	251	157	-185	-107

Protein and Energy Needs

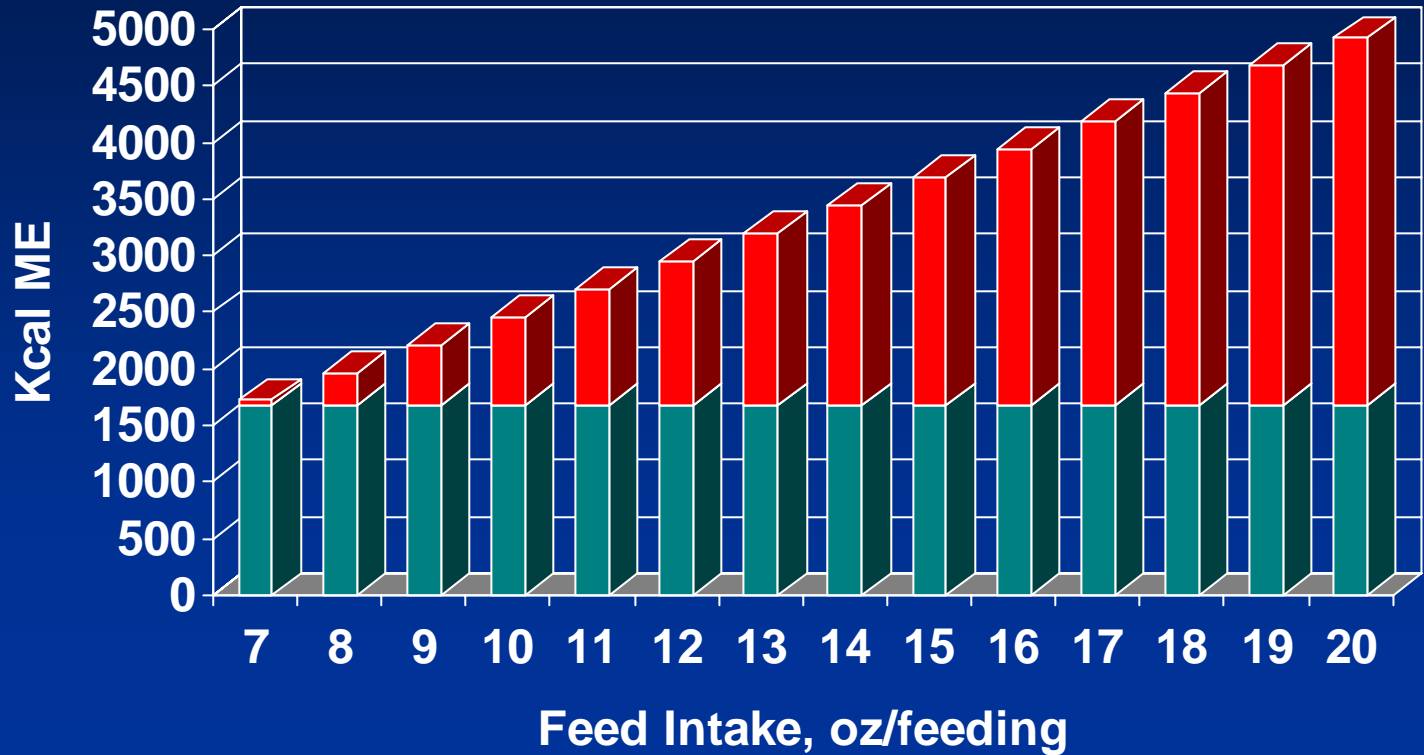

Protein and Energy Needs

- $ME = 0.1 LW^{0.75} + 0.84(LW^{0.355})(LWG^{1.2})$
- $ADP \text{ (g/d)} = 6.25[1/BV*(E+G+M*D)-M*D]$
- LW = Live Weight in Kg
- LWG = Live Weight Gain in Kg
- BV = Biological Value = 0.73
- E = Endogenous urinary N = $0.2 * LW^{0.75}$
- G = N stored in Gain = $30 * LWG$
- M = Metabolic fecal N = $2.2 * D$
- D = DMI in kg

Milk vs Grain

All Milk, No Grain?

“Each Suckled Calf consumed 16.9 kg milk/day; the Suckled Calves did not consume concentrates or hay, *although feed was freely available.*”

Source: Bar-Peled, *et al.*, 1997. J Dairy Sci 80:2523-2528

Putting
It to
Use

K.I.S.S.
System

Milk Replacer Feeding

- Must plan for MR intake, calf weight, and MR protein concentration
- Must be practical – 2 quart bottle
- I recommend 12-14 oz/feeding in 2 quarts
- Requires 24% CP/16% Fat
- Near-minimum cost of gain
- Maximize starter feed intake

Weaning

- Energy limits performance – not protein
- Solid feed intake prior to/during weaning may influence intake post-weaning
- Step-down may be superior to abrupt weaning for management of calves and post-weaning feed intake

Weaning Criteria

- Calves minimum 3 weeks old
- Calves consume starter feed at rate of 1% of initial Body Weight for 3 consecutive days
- Total dry starter feed intake is $\geq 9\%$ of initial Body Weight
- Body weight gain is $\geq 12\%$ of initial Body Weight
